(A)

Write an SQL solution to calculate the total number of bank accounts belonging to each salary category. The classification categories are:

1. **"Low Salary"**: All monthly salaries strictly less than \$20,000.

2. **"Average Salary"**: All monthly salaries in the inclusive range [\$20,000, \$50,000].

3. **"High Salary"**: All monthly salaries strictly greater than \$50,000. The final result table must report all three categories, even if a category contains zero accounts.

Output Table

category	accounts_count
Low Salary	1
Average Salary	1
High Salary	3

```
SELECT 'LOW CATEGORY' AS CATEGORY,
COUNT (ACCOUNT_ID) AS ACCOUNT_COUNT
FROM ACCOUNTS
WHERE INCOME<20000
UNION ALL
SELECT 'AVERAGE CATEGORY' AS CATEGORY,
COUNT(ACCOUNT_ID) AS ACCOUNT_COUNT
FROM ACCOUNTS
WHERE INCOME>20000 AND INCOME <=50000
UNION ALL
SELECT 'HIGH CATEORY' AS CATEGORY,
COUNT(ACCOUNT_ID) AS ACCOUNT_COUNT
FROM ACCOUNTS
WHERE INCOME >50000;
```

(B)

Design an Employee Management System database architecture by implementing the following operations sequentially:

1. Create and populate structural tracking tables for Departments, Employees, and Salaries.
2. Query the system using multi-table Joins to pull clear department breakdowns of employees, department and salaries, apply a 10% salary enhancement across all members of the HR department, and delete any individual salary record dropping strictly below \$30,000.
3. List all remaining active employees whose personal salary exceeds the overall company-wide average salary.

Output Table:

name	dept_name	salary
Alice	HR	50000
Bob	HR	25000
Charlie	IT	80000
David	IT	40000
Emma	Sales	45000

```
1. CREATE TABLE Departments (  
    dept_id INT PRIMARY KEY,  
    dept_name VARCHAR(50) NOT NULL  
);
```

```
CREATE TABLE Employees (  
    emp_id INT PRIMARY KEY,  
    name VARCHAR(50) NOT NULL,  
    dept_id INT REFERENCES Departments(dept_id)  
);
```

```
CREATE TABLE Salaries (  
    emp_id INT PRIMARY KEY REFERENCES Employees(emp_id) ON DELETE CASCADE,  
    salary INT NOT NULL  
);
```

2.

```
SELECT E.*, D.*, S.*
```

```
FROM
```

```
EMPLOYEE AS E
```

```
JOIN
```

```
DEPARTMENT AS D
```

```
ON
```

```
E.DEPT_ID = D.DEPT_ID
```

```
JOIN
```

```
SALARIES AS S
```

```
ON
```

```
E.EMP_ID = S.EMP_ID;

UPDATE SALARIES

SET SALARY = SALARY + SALARY * 0.10

WHERE EMP_ID

IN

(

SELECT E.EMP_ID

FROM EMPLOYEE AS E

JOIN

DEPARTMENT AS D

ON

E.DEPT_ID = D.DEPT_ID

WHERE D.DEPT_NAME = 'HR'

)
```

```
3. SELECT

E.emp_id,

E.name,

D.dept_name,

S.salary

FROM Employees E

JOIN Departments D

ON E.dept_id = D.dept_id

JOIN Salaries S

ON E.emp_id = S.emp_id

WHERE S.salary >

(

SELECT AVG(salary)

FROM Salaries

);
```

(C)

A pizza restaurant stores all the available pizza toppings and their ingredient costs in a table called `pizza_toppings`. Every customer must choose **exactly 3 different toppings** to prepare a pizza. Write a PostgreSQL query to generate **every possible 3-topping pizza combination** along with its **total ingredient cost**.

Requirements

Every pizza must contain **exactly 3 different toppings**.

The same topping **cannot appear more than once** in a pizza.

Different arrangements of the same toppings should be considered the **same pizza**.

Example:

Chicken, Pepperoni, Sausage

Pepperoni, Chicken, Sausage

Sausage, Chicken, Pepperoni

These are all the same pizza, so only **one** should appear.

Display the topping names separated by commas.

Display the total ingredient cost of each pizza.

Sort the output:

First by **highest total cost**

If two pizzas have the same cost, sort them alphabetically.

SELECT

CONCAT(T1.TOPPING_NAME, ',', T2.TOPPING_NAME, ',', T3.TOPPING_NAME) AS PIZZA,

(T1.INGREDIENT_COST+T2.INGREDIENT_COST+T3.INGREDIENT_COST)AS TOTAL_COST

FROM PIZZA_TOPPINGS AS T1

JOIN

PIZZA_TOPPINGS AS T2

ON

T1.TOPPING_NAME < T2.TOPPING_NAME

JOIN

PIZZA_TOPPINGS AS T3

ON

T2.TOPPING_NAME < T3.TOPPING_NAME;

(D)

Amazon wants to identify **returning customers** who made another purchase shortly after their first purchase. Write a PostgreSQL query to find all users who made **another purchase within 1 to 7 days** of an earlier purchase.

Requirements

1. Compare purchases **made by the same user only**.
2. Ignore comparisons where the same transaction is matched with itself.
3. The second purchase must occur **after** the first purchase.
4. Same-day purchases must **not** be considered.
5. The second purchase must occur within **7 days** of the first purchase.
6. Display only the **unique User IDs** that satisfy the above conditions.
7. Sort the output in ascending order of `user_id`.

Output Table

`user_id`

101

103

```
SELECT DISTINCT p1.user_id
FROM Purchases p1
JOIN Purchases p2
ON p1.user_id = p2.user_id
WHERE p2.purchase_date > p1.purchase_date
AND p2.purchase_date <= p1.purchase_date + INTERVAL '7 days'
ORDER BY p1.user_id;
```
